Title: Qualification Report for a Single-plex Direct Luminex Assay (dLIA) for Quantitation of IgG Antibodies to SARS-CoV-2 S1 in Protein Human Sera

SYNOPSIS

This report documents the results of the statistical analyses from assay qualification experiments of a single-plex direct Luminex immunoassay (dLIA) for quantitation of human IgG antibodies to subunit 1 (S1) of the spike (S) protein of severe acute respiratory disease coronavirus 2 (SARS-CoV-2) in human sera. The performance parameters examined in the assay qualification were (b) (4) linearity, precision and standard curve bias. From these data, the assay range, lower limit of quantitation, and descriptive statistics of assay parameters were determined. Key qualification outcomes are highlighted in the table below.

Key Qualification Outcomes

Antigen	Assay Range Lower Bound Plate Well IgG Concentration (U/mL) ^a	Assay Range Upper Bound Plate Well IgG Concentration (U/mL) ^a	LLOQ ^b Sample Dilution Adjusted IgG Concentration (U/mL) ^a	Assay Precision (b) (4) c
COVS1 ^d	0.002533	0.128000	1.2665	(b) (4)

- a. Units/mL.
- b. Lower Limit of Quantitation.
- c. (b) (4)
- d. Subunit 1 of the Spike protein of severe acute respiratory disease coronavirus 2.

The data provided in this report support the qualification of the single-plex dLIA for quantitation of human IgG antibodies that bind to the S1 protein of SARS-CoV-2 and confirm that the assay is suitable for its intended use when performed in accordance with standard operating procedures by qualified personnel.

Title: Qualification Report for a Single-plex Direct Luminex Assay (dLIA) for Quantitation

of IgG Antibodies to SARS-CoV-2 S1 Protein in Human Sera

Study Number: NA

Functional Area: Vaccine Research and Development

Test Facility: Pfizer Vaccine Research, 401 North Middletown Road,

Pearl River, NY 10965

Study Initiation Date: 15Apr2020

Study Completion Date: 01Jul2020

1. OBJECTIVES

This report summarizes the methodology, results, and statistical analysis of the assay qualification for a single-plex direct dLIA for quantitation of IgG antibodies to the S1 protein of SARS-CoV-2 in human serum, described in VR-TM-10293 (see Section 9). Assay qualification provides documented evidence that the assay, when performed in accordance with standard operating procedures (SOPs) by qualified personnel, is suitable for the intended to quantify S1-specific IgG antibody concentrations in human sera.

2. INTRODUCTION

The single-plex SARS-CoV-2 S1 IgG dLIA measures specific IgG antibodies binding to the S1 domain of the SARS-CoV-2 spike protein (S). This assay is described in the test method, VR-TM-10293 (see Section 9) and is based on the Luminex MagPlex xMAP technology.

Magnetic, fluorescent Luminex n	nicrospheres are coa	ated with (b) (4)	according to
VR-SOP-LC-11295 ¹ and then	(b) (4)	S1 protein. S1	coated microspheres
are added to serum samples, dilut microtiter assay plates for ^(b) (⁴⁾ h	ted in assay buffer a	and incubated, with	shaking, in a 96-well
washing and a purified	(b) (4)	anti-human Ig	gG secondary antibody
is added to the reaction wells. Th	ne secondary antibo	dy is incubated for	(b) (4) minutes at
(b) (4)°C. Unbound assay com	ponents are remove	d by washing and	the reaction is read on
a Bio-Plex reader. The fluorescen	nt protein coupled t	o the secondary an	tibody allows
measurement of the specific antib	oody bound to the ar	ntigen coated micr	ospheres.
Fluorescence is expressed as med	lian fluorescent inte	ensities (MFI), and	the assay results are
calculated against a reference star	ndard with arbitrary	assigned concentr	ration of
100.00 Units/mL. All sera are tes			
Test samples are initially tested a		\ , , \	,
dilutions are used to increase the	likelihood that at le	ast one result for a	ny sample will fall
within the useable range of the st			ria established in this
report, failed plates and samples i	may be repeated as:	required.	

The final assay results are expressed as the geometric mean concentration (GMC) of all sample dilutions that produced a valid assay result within the assay range. GMC results that are below the Lower Limit of Quantitation (LLOQ) are reported as Below Limit of Quantitation (BLQ).

3. GLOSSARY

Table 1. Terms and Definitions

Term	Definition		
Assay Range	Range of (b) (4) antibody concentrations that can be measured in the assay plate well that have (b) (4) linearity, precision, and standard curve bias within the limits described below. The assay range is generated from the most conservative lower and upper well concentration limits based on (b) (4) linearity, precision, and standard curve bias.		
Beads	Luminex Microspheres		
BLQ	Below Limit of Quantitation		
	(b) (4)		
CDAD	Clinical and Diagnostic Assay Development		
COVID-19	Coronavirus Disease 2019		
	(b) (4)		
dLIA	Direct Luminex ImmunoAssay		
	(b) (4)		
GMC	Geometric Mean Concentration		
HCID	High-throughput Clinical Immunoassays & Diagnostics		
IgG	Immunoglobulin G		
LIMS	Laboratory Information Management System		
LLOQ	Lower Limit of Quantitation - the lowest dilution-adjusted sample concentration that can be determined with precision (b) (4) and falls within the linear portion of the assay range.		
MFI	Median Fluorescent Intensity		
mL	Milliliter		
NHP	Non-human primate		
QA	Quality Assurance		
QCS	Quality Control Sample		
PE	Phycoerythrin		
	(b) (4)		
RT	Room Temperature 18-25°C		
S	Spike glycoprotein of severe acute respiratory disease coronavirus 2		
S1	Subunit 1 of the Spike protein		
SARS-CoV-2	Severe acute respiratory disease coronavirus 2		
Sample Concentration	(b) (4) antibody concentration calculated as the sample (b) (4) that fall within the assay range and the lower and upper parameter limits of the standard curve that is run on the same assay plate.		

Table 1. Terms and Definitions

Term	Definition			
Sample Range	Range of (b) (4) sample concentrations that can be quantified without predilution. The sample range is bounded by the LLOQ and ULOQ. Results below LLOQ are reported as BLQ. (b) (4)			
SOP	Standard Operating Procedure			
TM	Test Method			
ULOQ	Upper Limit of Quantitation - the highest be determined with precision (b) (4) sample concentration that can and falls within the linear portion of the assay range			
	(b) (4)			
VRD	Vaccine Research and Development			
Well concentration	(b) (4) antibody concentrations in the assay plate wells			

4. EXPERIMENTAL OUTLINE

4.1. Materials and Methods

Unique reagents prepared for this assessment are listed below, and all other materials are described in the SOPs referenced in Table 2. Specific details regarding reagent catalog and lot numbers and expiration, as well as the instrument identification numbers and maintenance details were documented in the assay worksheets within data packages.

4.1.1. Methods

Table 2. SOPs and Robotic Methods within Scope of this Protocol

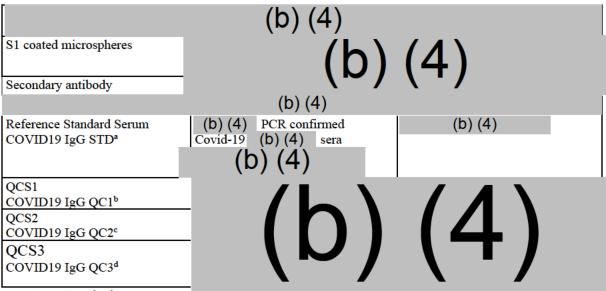

SOP Number	Work Described in SOP	Robotic Method Name	
VR-TM-10293 (see Section 9)	Test method	N/A	
VR-SOP-LC-11295 ¹	Bead coating method	N/A	
VR-SOP-LC-10627 ²	Preparation of buffers	N/A	
VR-SOP-LC-11186 ³	Sample preparation using (b) (4) robot	(b) (4)	

4.1.2. Critical Reagents

The critical reagents, including antigen-coated microspheres (beads), reference standard, QCS and (b) (4) secondary antibodies used in this assay qualification are listed in Table 3.

The reference standard serum is a (b) (4) human (b) (4) sera (COVID-19 (b) (4) sera drawn at least days after PCR-confirmed diagnosis from patients (b) (4) years of age) and assigned an arbitrary concentration of 100.00 U/mL of IgG antibodies to the S1 antigen.

Table 3. List of Critical Reagents

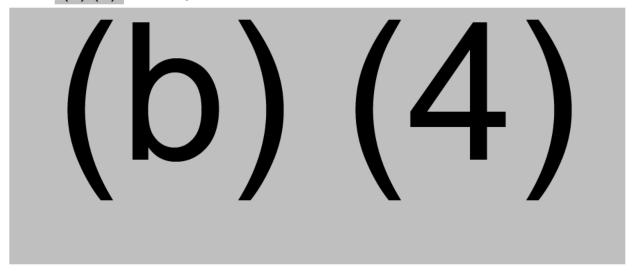

- a. Assay Standard.
- b. Assay Quality control serum 1.
- c. Assay Quality control serum 2.
- d. Assay Quality control serum 3.

4.2. Experimental Design

The following sections describe the experimental designs for evaluating the (b) (4) linearity, precision and standard curves.

4.2.1. (b) (4) Linearity

4.2.2. Precision

Precision describes the closeness of measurements for a sample tested multiple times. Precision is a measure of assay variability that contains both repeatability and intermediate precision. Repeatability measures the assay variability, usually within one assay run, whereas intermediate precision measures the variability within the same laboratory while taking into account relevant sources of variation due to operating conditions (eg, different analysts, time, reagent lots).

- The precision of the assay was examined using a panel of COVID-19 (b) (4) sera with IgG antibody concentrations intended to span the expected assay range and pre-pandemic human serum samples that have low or no specific antibodies for a total of samples. Refer to Supportive Table 12.2 for the precision samples used.
- All samples were tested in the assay at a single (b) (4) workstation, using the methods developed for clinical testing as described in VR-SOP-LC-11186³. Refer to Supportive Figure 11.2 for the assay plate layout used for the precision experiments.
- Precision measurements of the VR-TM-10293 (see Section 9) over (b) (4)

 (b) (4)

 (b) (4)

 Results were analyzed as described in Section 5.2.2 and Section 5.2.5.

4.2.3. Standard Curve Bias

(b) (4)

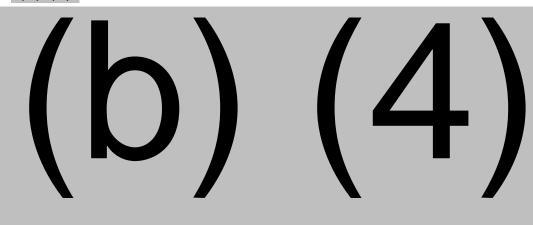

5. STATISTICAL METHODS

5.1. Sample Results

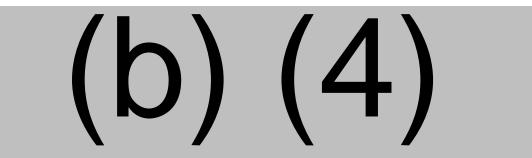

(b) (4)

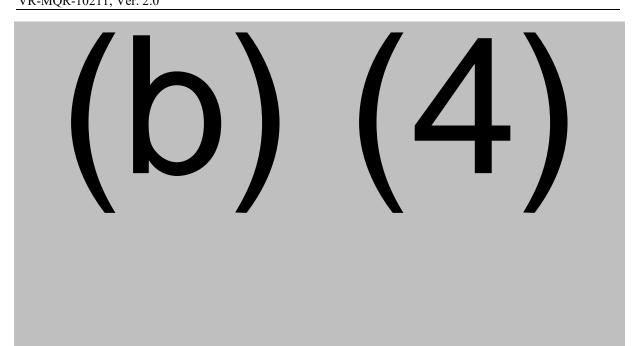

5.2. Statistical Analyses

5.2.1. (b) (4) Linearity

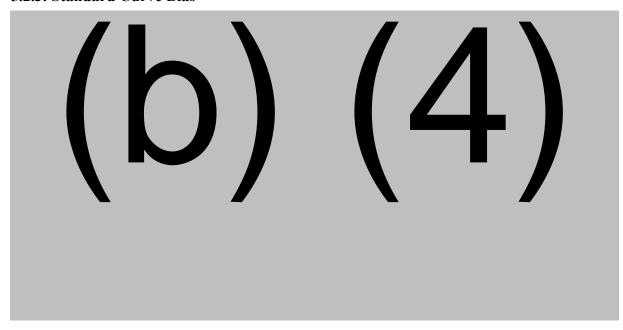

5.2.2. Precision

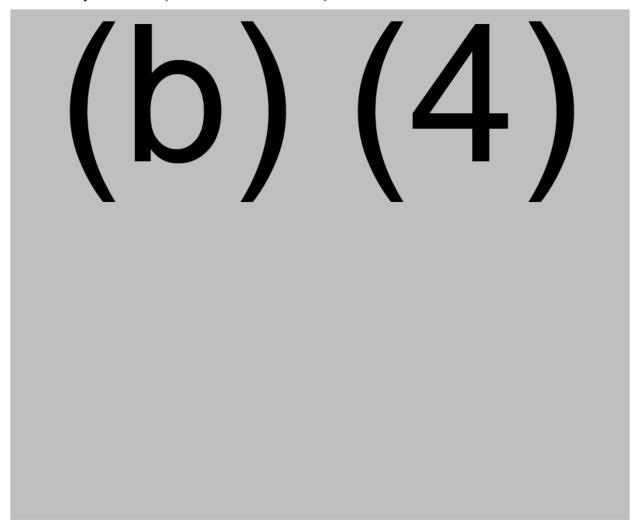

5.2.3. Standard Curve Bias

5.2.4. Assay Range

5.2.5. Assay Precision (Intermediate Precision)

5.2.6. Sample Quantitation Range

The quantitation limits are defined as the sample concentrations that are between the LLOQ and the ULOQ.

5.2.6.1. Lower Limit of Quantitation

The lower limit of quantitation (LLOQ) is the lowest sample concentration in the assay that can be determined with precision (b) (4) and falls within the linear portion of the assay range.

(b) (4)

(b) (4)

5.2.6.2. Upper Limit of Quantitation

The upper limit of quantitation (ULOQ) is the highest sample concentration that can be determined with precision (b) (4) and falls into the linear assay range. (b) (4) (b) (4)

5.2.7. Assay Run Performance

5.2.7.1. (b) (4)

(b) (4)

COVS1 ^a		(b) (4)		Lower 0.002533	Upper 0.128000

a. Subunit 1 of the Spike protein of severe acute respiratory disease coronavirus 2.

6.5. Assay Precision (Intermediate Precision)

The intermediate precision of the assay was evaluated using the (b) (4) as described in Section 5.2.5 and the results are summarized in Table 8. (b) (4)

(b) (4)

6.6. Sample Quantitation Range

6.6.1. Lower Limit of Quantitation

The LLOQ is the lowest sample IgG concentration in the assay that is precise (b) (4) and falls into the linear assay range. Unlike the lower limit of the assay range that is defined as a well concentration, the LLOQ is a dilution-adjusted sample concentration. As described in Section 5.2.6.1, LLOQ is defined as the dilution-adjusted lower limit of the assay range. Table 9 lists the LLOQ value for the SARS CoV-2 S1 IgG dLIA.

Table 9. Lower Limit of Quantitation (LLOQ)

6.7.2. Standard Curves

Descriptive statistics for the reference standard curves for S1 IgG are listed in Table 11.

(b) (4)

Table 11 presents suitability limits on standard curves which were calculated as described in Section 5.2.7.2.

Table 11. Descriptive Statistics for Standard Curve Parameters

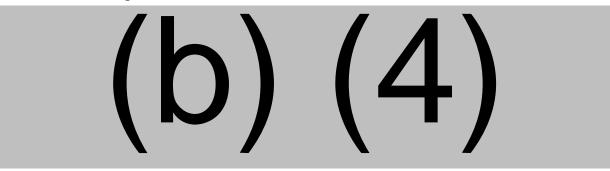

6.7.3. Quality Control Samples

Descriptive statistics for the QCS samples from the qualification data for the SARS-CoV-2 S1 IgG dLIA are listed in Table 12. (b) (4)

(b) (4) . Table 12 also shows QCS limits on the plates (refer to Section 5.2.7.3).

7. CONCLUSION

The data provided in this report support the qualification of the single-plex SARS-CoV-2 S1 IgG dLIA for quantitating S1 specific IgG in human sera. The assay is suitable for the intended use when performed in accordance with standard operating procedures by qualified personnel. The assay limits established from the data generated in this qualification will be used to support assay suitability during clinical testing until such limits are refined in a future validation.
