Human rhinovirus test positive	1 (<0.1)	2 (<0.1)		3 (<0.1)
White blood cell count increased	0	2 (<0.1)		2 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.
MedDRA version 23.0.

Post procedural bile leak	1 (<0.1)	0		1 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.
MedDRA version 23.0.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Food poisoning	5 (<0.1)	10 (<0.1)	2.00 (0.72, 5.59)	15 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Blood glucose increased	1 (<0.1)	2 (<0.1)		3 (<0.1)
Blood testosterone decreased	2 (<0.1)	2 (<0.1)		4 (<0.1)
Blood triglycerides increased	1 (<0.1)	2 (<0.1)		3 (<0.1)
Prostatic specific antigen increased	0	2 (<0.1)		2 (<0.1)
Aspartate aminotransferase increased	0	1 (<0.1)		1 (<0.1)
Blood creatinine increased	0	1 (<0.1)		1 (<0.1)
Blood oestrogen decreased	0	1 (<0.1)		1 (<0.1)
Blood potassium decreased	1 (<0.1)	1 (<0.1)		2 (<0.1)
Blood uric acid increased	0	1 (<0.1)		1 (<0.1)
Electrocardiogram QT prolonged	0	1 (<0.1)		1 (<0.1)
Electrocardiogram T wave inversion	0	1 (<0.1)		1 (<0.1)
Fibrin D dimer increased	0	1 (<0.1)		1 (<0.1)
Heart rate irregular	3 (<0.1)	1 (<0.1)		4 (<0.1)
Hepatic enzyme abnormal	0	1 (<0.1)		1 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Osteoarthritis	16 (0.4)	11 (0.3)	0.68 (0.32, 1.45)	27 (0.4)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.
MedDRA version 23.0.

Peritonitis	0	1 (<0.1)		1 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Visual impairment	2 (<0.1)	3 (<0.1)		5 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Nasal discomfort	1 (<0.1)	1 (<0.1)		2 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Dermatitis atopic	9 (<0.1)	3 (<0.1)	0.33 (0.10, 1.14)	12 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Liver function test increased	1 (<0.1)	1 (<0.1)		2 (<0.1)
Mammogram abnormal	0	1 (<0.1)		1 (<0.1)
Nerve conduction studies abnormal	0	1 (<0.1)		1 (<0.1)
Oestradiol decreased	0	1 (<0.1)		1 (<0.1)
Oxygen saturation decreased	3 (<0.1)	1 (<0.1)		4 (<0.1)
Respiratory rate increased	1 (<0.1)	1 (<0.1)		2 (<0.1)
Smear cervix abnormal	1 (<0.1)	1 (<0.1)		2 (<0.1)
Stool analysis abnormal	0	1 (<0.1)		1 (<0.1)
Streptococcus test negative	0	1 (<0.1)		1 (<0.1)
Thyroid function test abnormal	0	1 (<0.1)		1 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Onychomycosis	3 (<0.1)	6 (0.2)		9 (0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Cardiac arrest	0	1 (<0.1)		1 (<0.1)
Cardiomyopathy	0	1 (<0.1)		1 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Injection site urticaria	1 (<0.1)	11 (0.3)	10.95 (1.82, 65.95)	12 (0.2)
Injection site induration	7 (0.2)	10 (0.3)	1.42 (0.56, 3.61)	17 (0.2)
Injection site lymphadenopathy	2 (<0.1)	8 (0.2)	3.98 (0.96, 16.56)	10 (0.1)
Oedema peripheral	11 (0.3)	7 (0.2)	0.63 (0.25, 1.58)	18 (0.2)
Injection site rash	0	6 (0.2)		6 (<0.1)
Peripheral swelling	5 (0.1)	6 (0.2)		11 (0.1)
Chest discomfort	6 (0.2)	5 (0.1)		11 (0.1)
Injection site bruising	9 (0.2)	4 (0.1)	0.44 (0.14, 1.35)	13 (0.2)
Malaise	5 (0.1)	4 (0.1)		9 (0.1)
Asthenia	4 (0.1)	3 (<0.1)		7 (<0.1)
Axillary pain	1 (<0.1)	3 (<0.1)		4 (<0.1)
Injection site haematoma	1 (<0.1)	3 (<0.1)		4 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Ulnar nerve injury	1 (<0.1)	0		1 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.
MedDRA version 23.0.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Rhinitis allergic	15 (0.1)	12 (<0.1)	0.80 (0.38, 1.68)	27 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Malignant melanoma	5 (<0.1)	5 (<0.1)		10 (<0.1)
Squamous cell carcinoma of skin	9 (<0.1)	4 (<0.1)	0.44 (0.15, 1.36)	13 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.
MedDRA version 23.0.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

System Organ Class Preferred Term	Placebo (N=14741) n (%)	mRNA-1273 (N=14750) n (%)	Rate Ratio (95% CI)	Total (N=29491) n (%)
Musculoskeletal and connective tissue disorders (Cont.)				
Cervical spinal stenosis	3 (<0.1)	2 (<0.1)		5 (<0.1)
Exostosis	8 (<0.1)	2 (<0.1)	0.25 (0.06, 1.04)	10 (<0.1)
Facet joint syndrome	0	2 (<0.1)		2 (<0.1)
Foot deformity	7 (<0.1)	2 (<0.1)	0.29 (0.07, 1.21)	9 (<0.1)
Joint stiffness	3 (<0.1)	2 (<0.1)		5 (<0.1)
Limb mass	2 (<0.1)	2 (<0.1)		4 (<0.1)
Polyarthritis	2 (<0.1)	2 (<0.1)		4 (<0.1)
Rheumatoid arthritis	3 (<0.1)	2 (<0.1)		5 (<0.1)
Spondylitis	0	2 (<0.1)		2 (<0.1)
Tenosynovitis	1 (<0.1)	2 (<0.1)		3 (<0.1)
Bone lesion	0	1 (<0.1)		1 (<0.1)
Bone swelling	0	1 (<0.1)		1 (<0.1)
Chondrocalcinosis pyrophosphate	0	1 (<0.1)		1 (<0.1)
Compartment syndrome	0	1 (<0.1)		1 (<0.1)
Degenerative bone disease	0	1 (<0.1)		1 (<0.1)
Dupuytren's contracture	0	1 (<0.1)		1 (<0.1)
Floating patella	0	1 (<0.1)		1 (<0.1)
Fracture nonunion	0	1 (<0.1)		1 (<0.1)
Intervertebral disc disorder	0	1 (<0.1)		1 (<0.1)
Joint noise	1 (<0.1)	1 (<0.1)		2 (<0.1)
Ligament pain	0	1 (<0.1)		1 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.
MedDRA version 23.0.

Injection site induration	18 (0.1)	51 (0.3)	2.83 (1.67, 4.81)	69 (0.2)
Injection site macule	4 (<0.1)	45 (0.3)	11.24 (4.21, 30.03)	49 (0.2)
Injection site urticaria	1 (<0.1)	38 (0.3)	37.98 (6.58, 219.09)	39 (0.1)
Axillary pain	15 (0.1)	27 (0.2)	1.80 (0.97, 3.35)	42 (0.1)
Injection site rash	1 (<0.1)	25 (0.2)	24.98 (4.29, 145.49)	26 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Road traffic accident	14 (<0.1)	15 (0.1)	1.07 (0.52, 2.18)	29 (<0.1)
Skin abrasion	30 (0.2)	15 (0.1)	0.50 (0.27, 0.92)	45 (0.2)
Joint injury	9 (<0.1)	14 (<0.1)	1.55 (0.69, 3.51)	23 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Neoplasms benign, malignant and unspecified (incl cysts and polyps)	1 (0.3)	0		1 (0.1)
Prostate cancer recurrent	1 (0.3)	0		1 (0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Urinary tract infection	1 (1.2)	0		1 (0.6)
Viral upper respiratory tract infection	1 (1.2)	0		1 (0.6)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Gardnerella infection	1 (<0.1)	0		1 (<0.1)
Gastrointestinal viral infection	1 (<0.1)	0		1 (<0.1)
Gingival abscess	1 (<0.1)	0		1 (<0.1)
HIV infection	1 (<0.1)	0		1 (<0.1)
Herpes ophthalmic	1 (<0.1)	0		1 (<0.1)
Herpes virus infection	1 (<0.1)	0		1 (<0.1)
Influenza	2 (<0.1)	0		2 (<0.1)
Labyrinthitis	1 (<0.1)	0		1 (<0.1)
Lower respiratory tract infection	1 (<0.1)	0		1 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Somnolence	2 (<0.1)	2 (<0.1)		4 (<0.1)
Aura	0	1 (<0.1)		1 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.
MedDRA version 23.0.

Dysphonia	8 (<0.1)	5 (<0.1)	0.62 (0.21, 1.81)	13 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Chest discomfort	14 (<0.1)	12 (<0.1)	0.86 (0.40, 1.82)	26 (<0.1)
Peripheral swelling	11 (<0.1)	10 (<0.1)	0.91 (0.40, 2.09)	21 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.
MedDRA version 23.0.

Allergic sinusitis	2 (<0.1)	2 (<0.1)		4 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.
MedDRA version 23.0.

Table 14.3.1.8.13.2
Subject Incidence of Unsolicited Non-Serious TEAE by System Organ Class and Preferred Term in Overall Stage Safety Set

System Organ Class Preferred Term	Placebo (N=15162) n (%)	mRNA-1273 (N=15184) n (%)	Rate Ratio (95% CI)	Total (N=30346) n (%)
Gastrointestinal disorders (Cont.)				
Tooth disorder	3 (<0.1)	0		3 (<0.1)
Upper gastrointestinal haemorrhage	1 (<0.1)	0		1 (<0.1)
Uvulitis	1 (<0.1)	0		1 (<0.1)
Hepatobiliary disorders	18 (0.1)	26 (0.2)		44 (0.1)
Cholelithiasis	9 (<0.1)	14 (<0.1)	1.55 (0.69, 3.51)	23 (<0.1)
Hepatic steatosis	4 (<0.1)	5 (<0.1)		9 (<0.1)
Cholecystitis	0	4 (<0.1)		4 (<0.1)
Biliary colic	0	2 (<0.1)		2 (<0.1)
Biliary dyskinesia	0	1 (<0.1)		1 (<0.1)
Cholecystitis acute	1 (<0.1)	1 (<0.1)		2 (<0.1)
Hepatic cyst	2 (<0.1)	1 (<0.1)		3 (<0.1)
Jaundice	0	1 (<0.1)		1 (<0.1)
Nonalcoholic fatty liver disease	0	1 (<0.1)		1 (<0.1)
Hepatic haematoma	1 (<0.1)	0		1 (<0.1)
Hyperbilirubinaemia	1 (<0.1)	0		1 (<0.1)
Skin and subcutaneous tissue disorders	372 (2.5)	391 (2.6)		763 (2.5)
Urticaria	46 (0.3)	55 (0.4)	1.19 (0.81, 1.76)	101 (0.3)
Rash	47 (0.3)	43 (0.3)	0.91 (0.61, 1.38)	90 (0.3)
Dermatitis contact	41 (0.3)	34 (0.2)	0.83 (0.53, 1.30)	75 (0.2)
Pruritus	29 (0.2)	28 (0.2)	0.96 (0.58, 1.61)	57 (0.2)
Eczema	11 (<0.1)	18 (0.1)	1.63 (0.78, 3.40)	29 (<0.1)
Erythema	8 (<0.1)	17 (0.1)	2.12 (0.94, 4.80)	25 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Xerosis	1 (<0.1)	1 (<0.1)		2 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.
MedDRA version 23.0.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects.
MedDRA version 23.0.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Blood glucose increased	1 (<0.1)	0		1 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Substance-induced mood disorder	0	1 (<0.1)		1 (<0.1)
Substance-induced psychotic disorder	0	1 (<0.1)		1 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.
MedDRA version 23.0.

Transaminases increased	1 (<0.1)	0		1 (<0.1)
Injury, poisoning and procedural complications	29 (0.2)	27 (0.2)		56 (0.2)
Hip fracture	3 (<0.1)	3 (<0.1)		6 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Prostate cancer	3 (<0.1)	2 (<0.1)		5 (<0.1)
Splenic marginal zone lymphoma	0	1 (<0.1)		1 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.
