n = Number of exposed subjects who reported the event on any day within 7 days of the first injection.
Number of days is calculated as the days of the solicited adverse reaction reported within the 7 days of injection including the day of injection. If the solicited AR continues beyond 7 days, the consecutive days a solicited adverse reaction is reported after 7 days are included.

n = Number of exposed subjects who reported the event on any day within 7 days after any injection.
Number of days is calculated as the days of the solicited adverse reaction reported within the 7 days of injection including the day of injection. If the solicited AR continues beyond 7 days, the consecutive days a solicited adverse reaction is reported after 7 days are included. The number of days higher with solicited events after either the first or the second injection is summarized.

n = Number of exposed subjects who reported the event on any day within 7 days of the first injection.
Number of days is calculated as the days of the solicited adverse reaction reported within the 7 days of injection including the day of injection. If the solicited AR continues beyond 7 days, the consecutive days a solicited adverse reaction is reported after 7 days are included.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure. Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.
MedDRA version 23.0.

Nasopharyngitis	12 (<0.1)	5 (<0.1)	0.42 (0.15, 1.13)	17 (<0.1)
Pneumonia	11 (<0.1)	5 (<0.1)	0.45 (0.16, 1.25)	16 (<0.1)
Respiratory tract infection	4 (<0.1)	5 (<0.1)		9 (<0.1)
Subcutaneous abscess	2 (<0.1)	5 (<0.1)		7 (<0.1)
Enterovirus infection	2 (<0.1)	4 (<0.1)		6 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure. Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Table 14.3.1.8.1.1
Subject Incidence of Unsolicited TEAE by System Organ Class and Preferred Term up to 28 Days After Any Injection
Safety Set

System Organ Class Preferred Term	Placebo (N=15162) n (%)	mRNA-1273 (N=15184) n (%)	Rate Ratio (95% CI)	Total (N=30346) n (%)
Endocrine disorders	17 (0.1)	12 (<0.1)		29 (<0.1)
Hypothyroidism	10 (<0.1)	10 (<0.1)	1.00 (0.43, 2.34)	20 (<0.1)
Basedow's disease	0	1 (<0.1)		1 (<0.1)
Hypogonadism	1 (<0.1)	1 (<0.1)		2 (<0.1)
Thyroid cyst	0	1 (<0.1)		1 (<0.1)
Androgen deficiency	1 (<0.1)	0		1 (<0.1)
Autoimmune thyroiditis	1 (<0.1)	0		1 (<0.1)
Goitre	1 (<0.1)	0		1 (<0.1)
Hyperparathyroidism primary	1 (<0.1)	0		1 (<0.1)
Oestrogen deficiency	1 (<0.1)	0		1 (<0.1)
Thyroid mass	1 (<0.1)	0		1 (<0.1)
Metabolism and nutrition disorders	113 (0.7)	128 (0.8)		241 (0.8)
Hyperlipidaemia	21 (0.1)	23 (0.2)	1.09 (0.61, 1.96)	44 (0.1)
Type 2 diabetes mellitus	11 (<0.1)	21 (0.1)	1.91 (0.93, 3.89)	32 (0.1)
Hypercholesterolaemia	13 (<0.1)	12 (<0.1)	0.92 (0.43, 1.98)	25 (<0.1)
Vitamin D deficiency	14 (<0.1)	12 (<0.1)	0.86 (0.40, 1.82)	26 (<0.1)
Decreased appetite	9 (<0.1)	11 (<0.1)	1.22 (0.52, 2.87)	20 (<0.1)
Dehydration	6 (<0.1)	10 (<0.1)	1.66 (0.63, 4.40)	16 (<0.1)
Gout	7 (<0.1)	7 (<0.1)	1.00 (0.37, 2.73)	14 (<0.1)
Diabetes mellitus	5 (<0.1)	6 (<0.1)		11 (<0.1)
Glucose tolerance impaired	7 (<0.1)	6 (<0.1)	0.86 (0.30, 2.43)	13 (<0.1)
Hyperglycaemia	3 (<0.1)	3 (<0.1)		6 (<0.1)
Hypertriglyceridaemia	1 (<0.1)	3 (<0.1)		4 (<0.1)
Hyponatraemia	2 (<0.1)	3 (<0.1)		5 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure. Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Uveitis	0	1 (<0.1)		1 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure. Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Dry mouth	3 (<0.1)	2 (<0.1)		5 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure. Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure. Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure. Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Urticaria papular	1 (<0.1)	0		1 (<0.1)
Musculoskeletal and connective tissue disorders	90 (7.9)	105 (9.1)		195 (8.5)
Arthralgia	41 (3.6)	47 (4.1)	1.14 (0.76, 1.71)	88 (3.8)
Myalgia	29 (2.5)	38 (3.3)	1.30 (0.81, 2.09)	67 (2.9)
Back pain	10 (0.9)	8 (0.7)	0.79 (0.32, 1.95)	18 (0.8)
Musculoskeletal pain	4 (0.3)	8 (0.7)	1.99 (0.64, 6.19)	12 (0.5)
Pain in extremity	7 (0.6)	8 (0.7)	1.13 (0.43, 3.00)	15 (0.7)
Neck pain	0	7 (0.6)		7 (0.3)
Muscle spasms	6 (0.5)	5 (0.4)		11 (0.5)
Osteoarthritis	1 (<0.1)	4 (0.3)		5 (0.2)
Intervertebral disc protrusion	0	3 (0.3)		3 (0.1)
Rotator cuff syndrome	3 (0.3)	3 (0.3)		6 (0.3)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Cervical radiculopathy	1 (<0.1)	4 (<0.1)		5 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Back injury	2 (<0.1)	0		2 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Skin cancer	2 (<0.1)	1 (<0.1)		3 (<0.1)
Thyroid cancer metastatic	0	1 (<0.1)		1 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.
MedDRA version 23.0.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Hepatic cyst	1 (<0.1)	0		1 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.
MedDRA version 23.0.

Injection site papule	0	12 (0.2)		12 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.
MedDRA version 23.0.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Hypoaesthesia oral	0	2 (<0.1)		2 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Vertebral foraminal stenosis	1 (<0.1)	0		1 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Carotid bruit	0	1 (<0.1)		1 (<0.1)
Electrocardiogram T wave inversion	0	1 (<0.1)		1 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.
MedDRA version 23.0.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Pneumonia mycoplasmal	0	1 (0.2)		1 (0.1)
Rhinovirus infection	0	1 (0.2)		1 (0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Melanocytic naevus	0	3 (<0.1)		3 (<0.1)
Skin cancer	3 (<0.1)	3 (<0.1)		6 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Impaired healing	1 (<0.1)	0		1 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Epistaxis	1 (0.1)	0		1 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Sputum increased	0	1 (<0.1)		1 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Dermatitis atopic	5 (<0.1)	4 (<0.1)		9 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Table 14.3.1.8.6.3.1
Subject Incidence of Unsolicited TEAE by System Organ Class and Preferred Term by Risk Factor for Severe COVID (No, with 1 Risk Factor, with 2 or More Risk Factors) at Baseline up to 28 Days After Any Injection
Safety Set

Risk Group: Not at Risk

System Organ Class Preferred Term	Placebo (N=11705) n (%)	mRNA-1273 (N=11736) n (%)	Rate Ratio (95% CI)	Total (N=23441) n (%)
Injury, poisoning and procedural complications (Cont.)				
Rib fracture	2 (<0.1)	4 (<0.1)		6 (<0.1)
Bone contusion	2 (<0.1)	3 (<0.1)		5 (<0.1)
Cartilage injury	1 (<0.1)	3 (<0.1)		4 (<0.1)
Concussion	1 (<0.1)	3 (<0.1)		4 (<0.1)
Head injury	1 (<0.1)	3 (<0.1)		4 (<0.1)
Upper limb fracture	1 (<0.1)	3 (<0.1)		4 (<0.1)
Wrist fracture	3 (<0.1)	3 (<0.1)		6 (<0.1)
Ankle fracture	3 (<0.1)	2 (<0.1)		5 (<0.1)
Cervical vertebral fracture	0	2 (<0.1)		2 (<0.1)
Craniocerebral injury	0	2 (<0.1)		2 (<0.1)
Epicondylitis	3 (<0.1)	2 (<0.1)		5 (<0.1)
Ligament injury	0	2 (<0.1)		2 (<0.1)
Muscle rupture	2 (<0.1)	2 (<0.1)		4 (<0.1)
Tendon injury	1 (<0.1)	2 (<0.1)		3 (<0.1)
Thermal burn	3 (<0.1)	2 (<0.1)		5 (<0.1)
Alcohol poisoning	0	1 (<0.1)		1 (<0.1)
Bone fragmentation	0	1 (<0.1)		1 (<0.1)
Burns first degree	1 (<0.1)	1 (<0.1)		2 (<0.1)
Burns second degree	2 (<0.1)	1 (<0.1)		3 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Dermoid cyst	0	1 (<0.1)		1 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Laryngitis	0	3 (<0.1)		3 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Restless legs syndrome	1 (<0.1)	0		1 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Musculoskeletal pain	7 (0.2)	15 (0.5)	2.07 (0.87, 4.94)	22 (0.4)
Osteoarthritis	11 (0.4)	11 (0.4)	0.97 (0.43, 2.18)	22 (0.4)
Neck pain	8 (0.3)	10 (0.3)	1.21 (0.49, 2.97)	18 (0.3)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

System Organ Class Preferred Term	Placebo (N=15162) n (%)	mRNA-1273 (N=15184) n (%)	Rate Ratio (95% CI)	Total (N=30346) n (%)
Number of Subjects Reporting Unsolicited Adverse Events	6513 (43.0)	6310 (41.6)		12823 (42.3)
Number of Unsolicited Adverse Events	15229	14869		30098
Infections and infestations	2533 (16.7)	1717 (11.3)		4250 (14.0)
Upper respiratory tract infection	314 (2.1)	262 (1.7)	0.83 (0.71, 0.98)	576 (1.9)
Urinary tract infection	205 (1.4)	171 (1.1)	0.83 (0.68, 1.02)	376 (1.2)
Viral infection	159 (1.0)	164 (1.1)	1.03 (0.83, 1.28)	323 (1.1)
Sinusitis	120 (0.8)	133 (0.9)	1.11 (0.87, 1.41)	253 (0.8)
Suspected COVID-19	124 (0.8)	132 (0.9)	1.06 (0.83, 1.36)	256 (0.8)
COVID-19	979 (6.5)	86 (0.6)	0.09 (0.07, 0.11)	1065 (3.5)
Rhinovirus infection	75 (0.5)	84 (0.6)	1.12 (0.82, 1.52)	159 (0.5)
Herpes zoster	23 (0.2)	50 (0.3)	2.17 (1.33, 3.54)	73 (0.2)
Viral upper respiratory tract infection	41 (0.3)	41 (0.3)	1.00 (0.65, 1.53)	82 (0.3)
Tooth infection	36 (0.2)	36 (0.2)	1.00 (0.63, 1.58)	72 (0.2)
Tooth abscess	46 (0.3)	34 (0.2)	0.74 (0.48, 1.15)	80 (0.3)
Pharyngitis	32 (0.2)	32 (0.2)	1.00 (0.61, 1.62)	64 (0.2)
Gastroenteritis	41 (0.3)	31 (0.2)	0.76 (0.48, 1.20)	72 (0.2)
Ear infection	25 (0.2)	30 (0.2)	1.20 (0.71, 2.02)	55 (0.2)
Cellulitis	36 (0.2)	28 (0.2)	0.78 (0.48, 1.27)	64 (0.2)
Pharyngitis streptococcal	39 (0.3)	26 (0.2)	0.67 (0.41, 1.09)	65 (0.2)
Bronchitis	33 (0.2)	25 (0.2)	0.76 (0.45, 1.26)	58 (0.2)
Hordeolum	27 (0.2)	23 (0.2)	0.85 (0.49, 1.47)	50 (0.2)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.
MedDRA version 23.0.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.
MedDRA version 23.0.

Blepharitis	4 (<0.1)	5 (<0.1)		9 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.

Table 14.3.1.8.1.3
Subject Incidence of Unsolicited TEAE by System Organ Class and Preferred Term in Overall Stage
Safety Set

System Organ Class Preferred Term	Placebo (N=15162) n (%)	mRNA-1273 (N=15184) n (%)	Rate Ratio (95% CI)	Total (N=30346) n (%)
General disorders and administration site conditions (Cont.)				
Injection site bruising	21 (0.1)	19 (0.1)	0.90 (0.49, 1.66)	40 (0.1)
Malaise	14 (<0.1)	19 (0.1)	1.36 (0.69, 2.67)	33 (0.1)
Peripheral swelling	14 (<0.1)	19 (0.1)	1.36 (0.69, 2.67)	33 (0.1)
Chest pain	11 (<0.1)	15 (<0.1)	1.36 (0.64, 2.91)	26 (<0.1)
Non-cardiac chest pain	16 (0.1)	15 (<0.1)	0.94 (0.47, 1.87)	31 (0.1)
Oedema peripheral	17 (0.1)	14 (<0.1)	0.82 (0.41, 1.64)	31 (0.1)
Injection site papule	1 (<0.1)	13 (<0.1)	12.98 (2.18, 77.49)	14 (<0.1)
Injection site warmth	1 (<0.1)	7 (<0.1)	6.99 (1.12, 43.54)	8 (<0.1)
Reactogenicity event	5 (<0.1)	7 (<0.1)	1.40 (0.47, 4.17)	12 (<0.1)
Asthenia	10 (<0.1)	6 (<0.1)	0.60 (0.23, 1.59)	16 (<0.1)
Feeling hot	3 (<0.1)	6 (<0.1)		9 (<0.1)
Injection site haematoma	2 (<0.1)	6 (<0.1)		8 (<0.1)
Injection site haemorrhage	5 (<0.1)	6 (<0.1)		11 (<0.1)
Injection site paraesthesia	3 (<0.1)	6 (<0.1)		9 (<0.1)
Swelling face	4 (<0.1)	6 (<0.1)		10 (<0.1)
Vaccination site swelling	1 (<0.1)	6 (<0.1)		7 (<0.1)
Feeling abnormal	6 (<0.1)	5 (<0.1)		11 (<0.1)
Injection site joint pain	2 (<0.1)	5 (<0.1)		7 (<0.1)
Vaccination site pain	7 (<0.1)	5 (<0.1)	0.71 (0.24, 2.13)	12 (<0.1)
Death	2 (<0.1)	4 (<0.1)		6 (<0.1)
Influenza like illness	6 (<0.1)	4 (<0.1)		10 (<0.1)
Injection site mass	1 (<0.1)	4 (<0.1)		5 (<0.1)
Cyst	6 (<0.1)	3 (<0.1)		9 (<0.1)

A treatment-emergent adverse event (TEAE) is defined as any event not present before exposure to study vaccination or any event already present that worsens in intensity or frequency after exposure.
Percentages are based on the number of safety subjects. The rate ratio is calculated as the ratio of percentage of participants reporting the event in mRNA-1273 divided by that in Placebo. The 95% CI is calculated using the Miettinen and Nurminen method.
